

# VT Agency of Agriculture's Groundwater Monitoring Program

A look at the impact of agriculture on the waters of Vermont

## A brief history

- Created in 1986, headed by Jeff Comstock

### Goals

- Improve agricultural practices
- Protect groundwater
- Raise public awareness
- Provide for clean drinking water

## A brief history

- Sample private drinking water sources on and around agricultural use lands
- Funded by registration fees from pesticide and fertilizer companies
- Original focus was on corn herbicides only
- Sampling was expanded to include nitrate after a couple years
- Voluntary, confidential program

# The program today

- Goals, funding, and protocols remain largely unchanged
- Expanded testing capabilities and the number of samples taken annually statewide
- Legacy/monitoring sites (“works in progress”)
- Responsive sampling (complaints or concerns)
- Surface water studies (about 1/3 of samples)
- Current testing generally includes pesticides, nutrients, and bacteria

# Our working partners

- **VT Agricultural and Environmental Laboratory**  
does our testing, now in Randolph
- **VT Dept of Health, Div of Environmental Health**  
coordinates with us on outreach, referrals, drinking water standards
- **VAAFM Ag Water Quality Program**  
works on farms to monitor surface water quality and to help remediate contamination
- **Natural Resources Conservation Service**  
works to upgrade on-farm facilities to improve water quality (manure pits, drainage, clean catch diversion projects, grass waterways)
- **VT Geological Survey**  
helps us identify bedrock and surficial geology that impacts groundwater transport
- **Farmers and neighbors**  
trust us with access on their property for sampling

# Speaking of trust...

*Private wells have always been unregulated in Vermont (get your water tested!)*

## Changes coming: Act 161

- July 1, 2019
- Requires sampling of new water supplies at single-family homes
- Homeowner responsibility to test (~ \$125)
- VDH will maintain a database
- No enforcement provision

## *A typical scenario*

A Vermonter calls with concerns over a nearby farm spreading manure on fields, as they have a private well located in the vicinity...

...or they have  
concerns over  
herbicide  
applications on  
nearby corn fields

---

JOINT SOURCE AND PESTICIDE CASE INTAKE FORM

|  |  |

|  |  |
| 6. Details of concern                      |  |
|  |  |
| Was the individual called or someone else? |  |
| Remediation plan                           |  |

- Our program takes the info, gets best-guess measurements on setbacks, well depth and construction, and type of soil
- Tools include Google Earth, VT Well Drillers' Report, Nitrate Leaching Index, VGS maps

- Measure setbacks
- Scout for possible sources of contamination
- Sample untreated water for nitrate and corn herbicides
- Err on the side of caution and almost always sample, even if ag use may not be immediately nearby

- Sample results guide action, from none to possible remediation with the farmer or applicator
- A letter with test results, fact sheets, and a call are used to educate the well owner

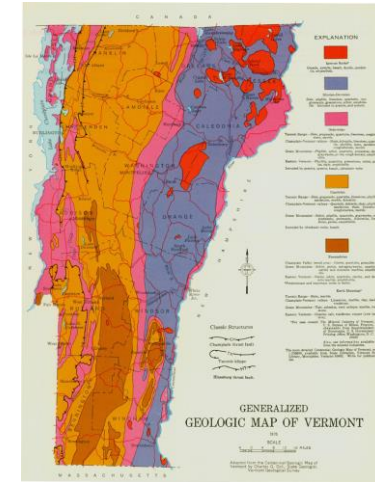

A bit about geology

# Geology

Bedrock – Waits River Formation on the eastern side of the state and into central VT – limestone and phyllite

- Rapid conveyance downward to aquifers due to fractures and bedding/foliation creating a “criss-cross” pattern in the bedrock
- Can be difficult to trace source of contamination because of deep fractures originating far away

Much of western Vermont,  
Champlain Valley

- Very thick overburden of clay
- Can be quite impermeable
- Can be several aquifers with aquitards between them at different depths
- Deep drilled wells tend to be safer from contamination due to layers of relative impermeability
- Surface waters are vulnerable to contamination from runoff

# Geology

# Geology

---

- Some groundwater moves extremely slowly (VGS has age-dated water to 70 years)
- This can frustrate well owners and make it difficult to gauge efficacy of remediation efforts
- Can take many years or even decades to see change
- Highlights importance of preventing contamination!

# Private Drinking Water Sources in Vermont

---

- Springs and shallow dug or drilled wells are more vulnerable to contamination, as they mix ground and surface water
- Drilled wells terminating in sand/gravel are also more vulnerable than those grouted into bedrock
- Drilled wells and springs are often found in fields and might not be marked
- We've seen pesticides and manure sprayed over well heads
- Always observe label restrictions regarding buffers around wells
- Minimum 50-ft buffer around private drinking water supplies when spraying

# Surface Water Studies

---

## **Ambient Surface Water Study (28 sites)**

Lake Champlain and tributaries near ag use

Sampling for neonicotinoids, corn herbicides and degradates, glyphosate, and nitrate

Third year of the study

Post-rain event sampling is done by DEC

All detections to date have been below aquatic invertebrate benchmarks

## **Miner Institute, Chazy NY**

Tile drain and field (paired study on 4 fields)

Sampling for corn herbicides and nitrate

A dark blue, irregular ink blot or splash shape is centered on a white background. The blot has a textured, slightly grainy appearance. Numerous small, dark blue ink splatters and droplets are scattered around the main blot, particularly towards the top and right edges, creating a sense of movement or a 'splashed' effect.

# Sampling

# What we sample for

- Nitrate
- Corn herbicides
- Glyphosate/AMPA
- Neonics

## Other analytes

- Tracers: bacteria, chloride
- Phosphorus (Ag Water Quality Program's on-farm inspectors)

A dark blue, irregular ink splash or blotch serves as the background for the text. The splash has a textured, watercolor-like appearance with some lighter blue and white areas around the edges, suggesting ink spreading on a surface. The word "Nitrate" is centered within the dark blue area.

Nitrate

# Nitrate

- Nitrogen is a necessary plant nutrient added to crops
- Nitrate is water-soluble and very mobile
- EPA drinking water standard is 10 ppm
- Sources of nitrate contamination include
  - Manure spread on fields and in storage (leaking pits)
  - Inorganic fertilizers
  - Silage leachate from bunks
  - Lawn fertilizers
  - Failed septic systems
  - Explosives from hydrofracking
  - Large piles of composting vegetative material

Agrichemicals

# Agrichemicals we sample for

## Corn Herbicides

- Acetochlor\*
- Alachlor\*
- Atrazine\*
- Dimethenamid\*
- Mesotrione
- Metolachlor\*
- Simazine
- Glyphosate\*
- Bicyclopyrone

*\*Plus degradates  
(breakdown products)  
for these*

## Neonics (insecticides)

- Clothianidin
- Imidacloprid
- Thiamethoxam

These are seed  
treatments for corn  
(~120,000 acres in VT)  
and soy (~3,000 acres in  
VT)

# Agrichemicals in Vermont

## What we find

Corn herbicides and their breakdown products (degradates)

- Atrazine, atrazine DEA
- Metolachlor, metolachlor ESA
- Acetochlor, acetochlor ESA
- Alachlor hasn't been used in Vermont since the early 1990s, but we occasionally still find traces of it

## What we don't find

GLYPHOSATE (Roundup™)/AMPA

- ~320 samples taken since 2006
- Surface and groundwater samples
- Targeted at high-risk areas
- **Zero detections at 0.05 ppb DL**
- Highly immobile (binds tightly)
- Short half-life (~28 days in VT)

# Industrial pesticide use in Vermont

Industrial pesticide use in Vermont: 2018

A look at our  
findings

# Terminology

- ***Locations*** are farm facilities or residences that have one or more *sites*
- ***Sites*** are individual water sources (drilled, dug, or driven point well, spring) – for simplicity we'll use the term “wells”
- ***Samples*** are waters collected from any site for testing

# 2018 Stats

# 2018 Sampling

- 15 employees sampling statewide
- All 14 counties sampled
- 585 water samples taken over all programs

# 2018 Number of Pesticide Detections

| <b><u>Number of wells* sampled = 170</u></b> | <b><u># (%)</u></b> |
|--|---------------------|
| Wells with any pesticide detection           | 27 (16%)            |
| Legacy wells with pesticide detection        | 25 (15%)            |
| New wells with pesticide detection           | 2 (0.01%)           |

*\*Includes drilled, driven point, dug wells, and springs*

Indicates that we have identified sites of concern around the state and we're monitoring them.

# 2018 Pesticides Detected

| <u>Parent Compound</u>     | <u># Positive Samples</u> | <u>Range, ppb</u>  | <u>Drinking water standard, ppb</u> | <u># of Wells Impacted</u> | <u># of Legacy Wells</u> | <u># of New Wells</u> |
|----------------------------|---------------------------|--------------------|-------------------------------------|----------------------------|--------------------------|-----------------------|
| Acetochlor                 | 0                         | -                  | 20                                  | 0                          | 0                        | 0                     |
| Alachlor                   | 0                         | -                  | 2                                   | 0                          | 0                        | 0                     |
| <b>Atrazine</b>            | <b>7</b>                  | <b>0.05 - 0.09</b> | <b>3</b>                            | <b>6</b>                   | <b>5</b>                 | <b>1</b>              |

| Dimethenamid ESA           | 0                         | -                  | Not established                     | 0                          | 0                        | 0                     |
| <b>Metolachlor ESA</b>     | <b>29</b>                 | <b>0.07 - 7.78</b> | <b>Not established</b>              | <b>25</b>                  | <b>23</b>                | <b>2</b>              |
|                            |                           |                    |                                     |                            |                          |                       |
| Detection limit = 0.05 ppb |                           |                    |                                     |                            |                          |                       |
|                            |                           |                    |                                     |                            |                          |                       |

\* Drinking water standards are not established for degradates; we use parent standards, although degradates are generally less toxic.

# New sites

## SITE 1

- 80' drilled well terminating in a thick overburden of sand/gravel in Addison County
- ½ mile down-gradient from several large farm fields (~86 acres) in continuous corn since at least 2011
- Samples contain atrazine, atrazine DEA, alachlor ESA, metolachlor ESA, and high nitrates
- May result in a large-scale investigation, as it's in a rural/suburban area

# New sites

## SITE 2

- Surface spring located in a wooded area
- Adjacent to a longstanding cornfield in Franklin County
- Samples contain acetochlor ESA, alachlor ESA, atrazine DEA, metolachlor ESA, bacteria, and high nitrates
- Very rural area, homeowners are saving up to drill a well

# Nitrate Sampling Results

---

- Total wells sampled for nitrate = 132
- Total wells  $\geq 10$  ppm nitrate (drinking water standard) = 22 wells
- Of those 22 wells, 16 were from legacy sites (on or near farm)
- Of remaining 6 wells
  - 2 were from failed septic systems
  - 3 were new detections on farms
  - 1 was from a farm neighbor with a vulnerable surface water spring

# The Bottom Line

- 93% of 2018 pesticide detections came from sites already being monitored
- Degradates are detected more commonly
- Metolachlor ESA is found most frequently
- Nitrate contamination is also concentrated around a few large farms and is not widespread in the state
- Pesticide detections have all been below drinking water standards
- Attributable to improving ag practices and closer oversight by VT Agency of Ag
- Bedrock geology can make contamination source and groundwater flow direction difficult to identify

# Questions?

If I don't know the answer,  
I'll find it and get back to you!

Patti Casey
